TASK 2 — CRYPTOCURRENCY PORTFOLIO ANALYSIS

Bitcoin (BTC) • Ethereum (ETH) • Solana (SOL)

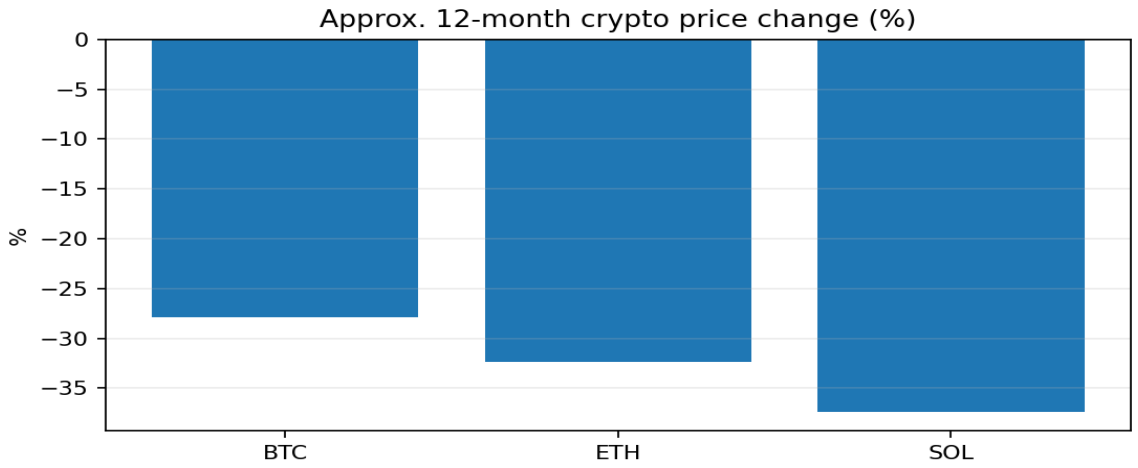

Prepared: 18 October 2026 | Student name: ~~Fardowsa Abdisalam Ali~~

Educational assignment only; not investment advice. Verify figures and source dates before submission.

1. Objective and method

This report compares source-reported price change and annualized volatility over approximately 12 months. Bitcoin figures are reported through 15 October 2026; Ethereum and Solana use daily closes from 11 October 2025 to 11 October 2026. These windows differ by a few days, so results are indicative rather than a perfectly synchronized backtest.

Asset	Start close (USD)	End close (USD)	Approx. change	Annualized volatility
Bitcoin (BTC)	n/a	$81,567.00	-27.9%	44.0%
Ethereum (ETH)	3749	$2,534.00	-32.4%	62.0%
Solana (SOL)	177.8	$111.22	-37.4%	65.4%

2. Asset profiles

Bitcoin (BTC)

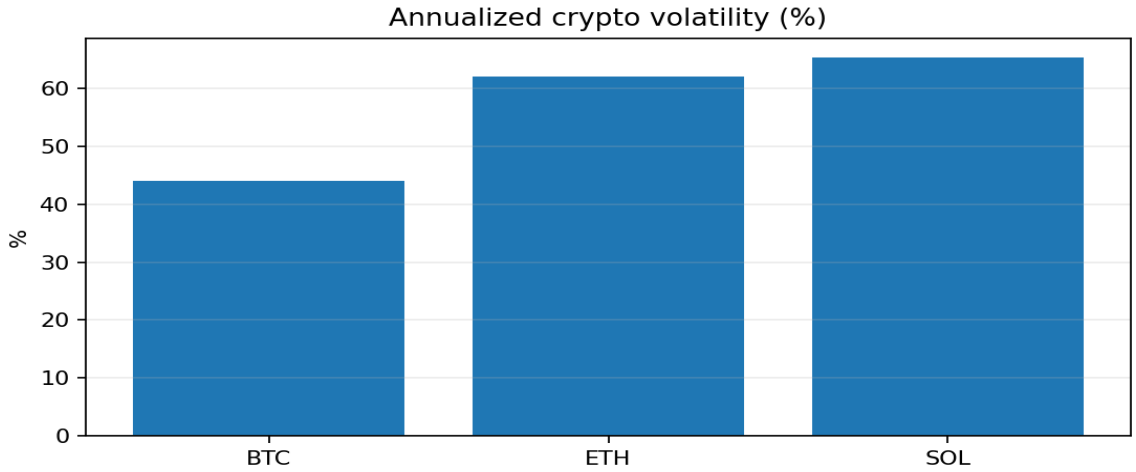

Digital asset with capped issuance; high-risk store-of-value thesis.

Ethereum (ETH)

Smart-contract network for decentralized applications.

Solana (SOL)

High-throughput smart-contract network.

3. Risk and performance interpretation

All three assets declined in the cited windows. Solana had the largest reported decline (–37.4%) and highest annualized volatility (65.4%); Ethereum declined 32.4% with 62.0% volatility. Bitcoin's reported one-year return was –27.9% and volatility 44.0%. Volatility measures the size of price movements, not direction. Cryptoassets can lose a substantial portion of their value, and past performance is not a forecast.

4. Risk controls and conclusion

Keep crypto within a predefined allocation that can be lost without jeopardizing essential needs; avoid borrowing; use position limits and rebalancing; secure wallets and exchange accounts; and review custody, liquidity, smart-contract and regulatory risks. BTC, ETH and SOL have different use cases but all can experience large drawdowns. A disciplined risk limit is more useful than a short-term price forecast.
